                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 유
                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                               This invention relates to a method for the protection against infection of a poixlothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed 05pA, or an immunogenic fragment of 05pA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents the amino acid sequence of C17E2, a P. salmonis OspA construct optimised for expression in Escherichia coli, fused to an undefined N-terminal fusion partner. The fusion protein is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LGNSYVDNTSKVTANFVKETASPTSTYDTYLDPSHMRGCLQGSSLIIISVFLVGCAQNFS 120

The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprocein), its variants, non-lipidated form or antigenic peptides derived or.synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsia salmonis as a vaccine to induce immunity in fin-fish against Rickettsial septicaemia and other related respectively in fin-fish against Rickettsial septicaemia and other related. This is the amino acid sequence of the Escherichia coli codon optimised outer surface lipoprotein OspA (17e2) with an N-terminal fusion used in the creation of the vaccine described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The invention describes a method of protecting a polkilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of form or infinitish against Rickettsial septicaemia and other related Rickettsial diseases caused by either a virus, bacteria or parasite. This is the amino acid sequence of the Escherichia coli codon optimised outer surface lipoprotein OspA (17e2) used in the creation of the vaccine described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 LGGLIGSKIGQSMDQQDXIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQE 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a method for the protection against infection of a poixlothermic fish by the bacterial pathogen, Piscirckettsia asalmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed 08pA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkliothermic fish, against the bacterial pathogen P. Salmonis. The method is also useful for protecting against salmonis rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents optimised P. salmonis OspA protein 1782. The DNA encoding OspA 1782 (AAF86247) has been optimised for expression in Ecsherichia coli. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         96 MRGCLQGSSLIIISVFLVGCAQNFSRQEVGAATGAVVGGVAGQLFGKGSGRVSMAIGGAV 155

This invention relates to a method for the protection against infection of a poixilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA, in the form of a vaccine. The method is used for protecting animals, particularly poixilothermic fish, against the bacterial pathogen p. salmonis. The method useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents P. salmonis OspA protein. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQER 216

The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials.
The method involves treating the polysaccharide structure with a
polysaccharide binding domain (PBD) fusion protein. The method is
used to alter the structural, chemical, physical, electrical and
mechanical properties of polysaccharide materials such as paper,
yarns, fibers and textiles, using biological crosslinking agents.
The polysaccharide containing materials have improved mechanical
properties such as wet strengths, durability and elasticity. The PBD
reagent is applied in the forming steep in fluting paper manufacture
which eliminates the sizing steep. The use of a biological crosslinker
improves the recyclability of paper products. The PBD reagent maintains
the fine fibers in a slurry therefore resulting in better recovery of
raw materials. The PBD molecules are eluted by strong alkaline conditions
which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LGNSYVDNTSKVTANFVKETASPTSTYDTYLDPSHMRGCLQGSSLIIISVFLVGCAQNFS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a method of protecting a poikilothermic fish against infection by the bacterial pathogen Piscirickettsia Salmonis comprising administering either intraperitoneally, by immersion or orally, an immunogenic amount of principal antigen, the OspA (outer surface lipoprotein), its variants, non-lipidated form or antigenic peptides derived or synthesized with or without an adjuvant. The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain piscirickettsia salmonis as a vaccine to induce immunity in fin-fish against Rickettsial septicaemia and other related Rickettsial diseases caused by either a virus, bacteria or parasite. This is the amino acid sequence of the Piscirickettsia salmonis outer surface lipoprotein, OspA, used in the creation of the vaccine described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GGLIGSKIGQSMDQQDKIKLNQSLEKVKAGQVTRWRNPDTGNSYSVEPVRTYQRYNKQER 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials. The method involves treating the polysaccharide structure with a
polysaccharide binding domain (PBD) fusion protein. The method is
used to alter the structural, chemical, physical, electrical and
mechanical properties of polysaccharide materials such as paper,
yarns, fibers and textiles, using biological crosslinking agents.
The polysaccharide containing materials have improved mechanical
properties such as wet strengths, durability and elasticity. The PBD
reagent is applied in the forming stage in fluting paper manufacture
which eliminates the sizing step. The use of a biological crosslinker
improves the recyclability of paper products. The PBD reagent maintains
the fine fibers in a slurry therefore resulting in better recovery of
raw materials. The PBD molecules are eluted by strong alkaline conditions
                                                                                                                                                                                                                                                                                                                                                               /label= Unknown

binds crystalline with a Kd ranging from 1.5 microM - 0.5 microM, binds crystalline with a Kd ranging from 1.5 microM - 0.5 microM, pref. with a Kd cf.1.2 microM, esp. <1.0 microM. The protein and the encoding DNA are claimed, as is a CBD fusion protein (FP) comprising the CBD and a second protein. The second protein is pref. Protein A, heparinase, a hormone or an enzyme capable of degrading an environmental pollutant, or an HSP, HSP antibody, cross-reactive HSP-related protein or an antigenic portion of this. The CBD and FP may be used in drug delivery, affinity sepus. and diagnostic techniques. CBD nucleic acid may be obtd. from a variety of cell sources that produce CBDs that bind with high affinity and in a reversible manner or that produce CBD encoding mRNA. The preferred (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                        Isolated cellulose binding domain and fusion proteins - with applications. including drug delivery, affinity separations.
                                                                                                                                                                                                                                                                          Shoseyov 0,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials.
The method involves treating the polysaccharide structure with a
polysaccharide binding domain (BBD) fusion protein. The method is
used to alter the structural, chemical, physical, electrical and
mechanical properties of polysaccharide materials such as paper,
yarns, fibers and textiles, using biological crosslinking agents.
The polysaccharide containing materials have improved mechanical
properties anch as wet strengths, durability and elasticity. The PBD
reagent is applied in the forming stage in fluting paper manufacture
which eliminates the sizing step. The use of a biological crosslinker
if improves the recyclability of paper products. The PBD reagent maintains
the fiber in a slurry therefore resulting in better recovery of
raw materials. The PBD molecules are eluted by strong alkaline conditions
which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           strong alkaline conditions

Clostridium cellulovorans protein A-cellulose binding domain.
                                       24-SEP-2001
                AAE05748;
    linking and/or modifying the properties of polysaccharide materials. The method involves treating the polysaccharide structure with a polysaccharide binding domain (PBD) Gusion protein. The method is used to alter the structural, chemical, physical, electrical and mechanical properties of polysaccharide materials such as paper, yarns, fibers and textiles, using biological crosslinking agents. The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker improves the recyclability of paper products. The PBD reagent maintains the fine fibers in a slurry therefore resoluting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LGNSYVDNTSKVTANFVKETASPTSTYDTYLDPSHMRGCLQGSSLIIISVFLVGCAQNFS 120

The present invention relates to methods and compositions for cross-
linking and/or modifying the properties of polysaccharide materials.

The method involves treating the polysaccharide structure with a
polysaccharide binding domain (PBD) fusion protein. The method is
used to alter the structural, chemical, physical, electrical and
mechanical properties of polysaccharide materials such as paper,
yarns, fibers and textiles, using biological crosslinking agents.
The polysaccharide containing materials have improved mechanical
properties such as wet strengths, durability and elasticity. The PBD
reagent is applied in the forming stage in flutting paper manufacture
which eliminates the sizing step. The use of a biological crosslinker
improves the recyclability of paper products. The PBD reagent maintains
the fine fibers in a slurry therefore resulting in better recovery of
raw materials. The PBD molecules are eluted by strong alkaline conditions
which enhances the ability of the alkaline glue used in binding to

This sequence contains a part of CBP A protein and a part of protein A derived from pRIT2T vector sequence. Note: This sequence is stated to be the same as that shown as SEQ ID No: 8 in the sequence listing of the specification. However this sequence has 2 additional residues at its C-terminal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparation of a polysaccharide containing material having at least desired structural, chemical, physical, electrical and/or mechanical
                                                                                                                                                                                                                                                                                                                    1..263

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a luciferase of the invention. The invention relates to Renilla mulleri, Gaussia and Pleuromamma luciferase and Frenilla and Ptilosarcus green fluorescent protein (GFP) nucleic acids and proteins. The luciferases and GFPs can be used in bioluminescence-generating systems, assays, screening methods, diagnostic method and articles of manufacture. They can be expressed using eq. bacterial, yeast, fungal, plant, insect or animal cells. The Renilla mulleri, Gaussia and Pleuromamma luciferase or Renilla or Ptilosarcus GFPs can be used in e.g. toys, cosmetics, fountains, personal care items, fairy dust, beverages, soft drinks, foods, textile products, bubbles,

also relates to sequences of the bioluminescence generating system (e.g. luciferase). R. reniformis GFP are used in diagnostic methods and in the production of novelty items such as toys (e.g. squirt gun, pellet gun, toy "Halloween" eggs, toy cigarettes, board/card game toys), finger paints, slimy play material, bubbles in bubble making toys, fishing lures, dolls, sparklers, magic wand toys, balloons, personal care item (e.g. cosmetic, bath powders, body remans, tooth pastes, mouth wash, soaps, body paints, bubble bath), ornamental transgenic plants, fountain, fairy dust, food (gelatins, icings, transgenic plants, champagne, milk, soft drinks, ice cubes, ice, dry ice, beverage), textile (foot bag, clothing) and/or paper product (greeting cards, wrapping paper). The present sequence is CBD-luciferase fusion protein from Gaussia species.

### RESULT D33971

rickettsial common antigen precursor - Rickettsia prowazekii
N;Alternate names: 17kD surface antigen; outer membrane protein (omp); RP833
C;Species: Rickettsia prowazekii
C;Date: 16-Mar-1990 #sequence\_revision 16-Mar-1990 #text\_change 03-Nov-2000
C;Accession: D33971; B71645
R;Anderson, B.E.; Tzianabos, T.
J. Bacteriol. 171, 5199-5201, 1989

T "identification of the cellulose-binding domain of the cellulosome subunit S1 from Clostridium thermocellum YS.";

FEMS Microbiol. Lett. 78:181-186(1992).

-!- FUNCTION: ACTG AS A SCAFFOLDING PROTEIN IN THE CELLULOSOME. IT PROMOTES BINDING OF CELLULOSE TO THE CATALYTIC DOMAINS OF THE CELLULOSTRIC ENZYMES PRODABLY THROUGH THE BINDING OF THE REPRATED DOMAINS WITH THE DUPLICATED SEGMENT OF 24 AMINO ACIDS REPERTED DOMAINS WITH THE DUPLICATED SEGMENT OF 24 AMINO ACIDS PRESENT IN CATALYTIC SOUNDINS OF THE CELLULOSOME.

-!- SUBCELLULAR LOCATION: CELL SUBRACE.

-!- DOMAIN: THE COHESIN DOMAINS BIND TO THE DOCKERIN DOMAIN BOY BY THE CATALYTIC COMPONENTS OF THE CELLULOSOME.

-!- SIMILARITY: Contains at least 3 cohesin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Purification and properties of a novel type of exo-1,4-beta-glucanase (avicelase II) from the cellulolytic thermophile Clostridium stercorarium.";
Eur. J. Biochem. 200:379-385(1991).
-!- CATALYTIC ACTIVITY: Hydrolysis of 1,4-beta-D-glucosidic linkages in cellulose and cellotetraose, releasing cellobiose from the non-reducing ends of the chains.
-!- SIMILARITY: BELONGS TO CELLULASE FAMILY L (FAMILY 48 OF GLYCOSYL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 12.2%; Score 162.5; DB 1; Length 914; Best Local Similarity 37.8%; Pred.
